# Topics for today's presentation

- ▶ Finding the rank of a given element in a tree.

## Problem 5: Finding the rank of a given element in a tree.

What is the rank of an element in a tree?

- ▶ The rank of a node holding a key "k" is defined as the total number of nodes in the tree that have a key value strictly less than k.

## Problem 5: Rank Function Algorithm

---

**Algorithm 1** Function to find the rank

---

```
1: Rank() [Start from the parent node of the tree]
2: if node == NULL then
3:   return 0
4: else if node.key > key then
5:   return rank(node.left) [recursive call]
6: else if node.key < key then
7:   return (1 + size(node.left) + rank(node.right))
8: else
9:   return (1 + size(node.left))
10: end if
```

---

# Example of the algorithm

key = 6

---

## Algorithm 1 Dynamic Programming algorithm

---

```
1: Rank() [Start from the parent node of the tree]
2: if node == NULL then
3:   return 0
4: else if node.key > key then
5:   return rank(node.left) [recursive call]
6: else if node.key < key then
7:   return (1 + size(node.left) + rank(node.right))
8: else
9:   return (1 + size(node.left))
10: end if
```

---

Figure 1: Step 1

# Example of the algorithm

key = 6

---

**Algorithm 1** Dynamic Programming algorithm

---

```
1: Rank() [Start from the parent node of the tree]
2: if node == NULL then
3:   return 0
4: else if node.key > key then
5:   return rank(node.left) [recursive call]
6: else if node.key < key then
7:   return (1 + size(node.left) + rank(node.right))
8: else
9:   return (1 + size(node.left))
10: end if
```

---

$(1 + 1 + \text{rank}(\text{node}(6)))$

Figure 2: Step 2

# Example of the algorithm

key = 6

---

**Algorithm 1** Dynamic Programming algorithm

---

```
1: Rank() [Start from the parent node of the tree]
2: if node == NULL then
3:   return 0
4: else if node.key > key then
5:   return rank(node.left) [recursive call]
6: else if node.key < key then
7:   return (1 + size(node.left) + rank(node.right))
8: else
9:   return (1 + size(node.left))
10: end if
```

---

$$\begin{aligned}(1 + 1 + \text{rank}(\text{node}(6))) &= (2 + (1 + \text{node}(6).\text{left})) \\ &= (2 + 1 + 1) = 4 \text{ (Rank)}\end{aligned}$$

Figure 3: Step 3

## Problem 5: Finding the rank of a given element in a tree.

- ▶ How do you find the size of the sub-tree used in the previous algorithm?

## Problem 5: Rank Function Algorithm

---

**Algorithm 2** Function to find the size of a sub-tree given a node

---

```
1: Size()  
2: if node == NULL then  
3:   return 0  
4: else  
5:   return (1 + size(node.left) + size(node.right))  
6: end if
```

---

## Complexity Analysis

Complexity Analysis		
Algorithm	Time	Space
Rank of an element	$K * O(N) * *$	$O(N)$

where  $K$  is the number of layers in the tree.
